Part 2 FRCOphth Written Sample MCQs

The ROYAL COLLEGE of
OPHTHALMOLOGISTS

1. Trauma

A four year old boy is seen in the Emergency Department with an 8mm laceration of the upper lid not involving the lid margin. He says that he injured his eye on the corner of the table. He has mild ptosis on the left side and there is herniation of orbital fat through the laceration. The eye examination is normal. Which of the following is the next MOST appropriate step?

- A. CT of the orbit
- B. Glue the laceration
- C. MRI of the orbit
- D. Ultrasound the orbit

Correct Response: A

Which one of the following statements is MOST likely to be correct for a patient presenting with a symptomatic retinal dialysis?

- A. Other signs of blunt ocular trauma are usually present
- B. The duration of the retinal detachment is generally a week or less
- C. The macula is likely to be detached
- D. The site of the dialysis is most commonly infero-nasal

Correct Response: C
